

Five great reasons you should adopt cloud-managed networking

1. SIMPLICITY

Simplified network management and control by unifying all functions under a single umbrella, and utilizing built-in automation. This alleviates the IT support burden, freeing up resources to work on other high-value projects.

2. VISIBILITY

Gain insights into network performance, resource consumption, and overall network health. You'll get this valuable visibility for all users, devices applications and network infrastructure, across all your sites, virtually in real-time via a single pane of glass dashboard.

3. EFFICIENCY

Reassurance that your network is constantly being analyzed to maintain optimal performance. Network devices, such as Wi-Fi APs and switches, maintain up-to-date firmware and security patches.

4. SCALABILITY

Scale up or down your network management solution to match your changing business needs, without compromising user experiences or worrying about incurring extra costs.

5. COST

Ensure an attractive total cost of ownership from the ground up. Optimal scalability helps you avoid excess CapEx, while greater simplicity and enhanced visibility reduce OpEx by streamlining IT training, management and helpdesk operations.
